1. Let \mathcal{M} be a Riemannian Manifold with sectional curvature identically zero. Show that, for every $p \in \mathcal{M}$, the mapping

$$\exp_p : \mathcal{B}_\varepsilon(0) \subset T_p\mathcal{M} \rightarrow \mathcal{B}_\varepsilon(p)$$

is an isometry, where $\mathcal{B}_\varepsilon(p)$ is a normal ball at p .

2. Let $\tilde{\mathcal{M}}$ be a covering space of a Riemannian Manifold \mathcal{M} . Show that it is possible to give $\tilde{\mathcal{M}}$ a Riemannian structure such that the covering map $\pi : \tilde{\mathcal{M}} \rightarrow \mathcal{M}$ is a local isometry (this metric is called the covering metric). Show that $\tilde{\mathcal{M}}$ is complete in the covering metric iff \mathcal{M} is complete.

3. If a complete simply connected Riemannian Manifold \mathcal{M} has a pole, then \mathcal{M} is diffeomorphic to \mathcal{R}^n , $n = \dim \mathcal{M}$.

4. Introduce a complete Riemannian metric on \mathbb{R}^2 . Prove that

$$\lim_{r \rightarrow \infty} \left(\inf_{x^2 + y^2 \geq r^2} \mathcal{K}(x, y) \right) \leq 0$$

where $(x, y) \in \mathbb{R}^2$ and $\mathcal{K}(x, y)$ is the Gaussian curvature of the given metric at (x, y) .

5. Let $\gamma : [0, a] \rightarrow \mathcal{M}$ be a geodesic segment on \mathcal{M} such that $\gamma(a)$ is not conjugate to $\gamma(0)$. Then γ has no conjugate points on $(0, a)$ iff for all proper variations of γ

$$\exists \delta > 0, \text{ s.t. } 0 < |s| < \delta \Rightarrow \mathcal{E}(s) > \mathcal{E}(0)$$

In particular, if γ is minimizing, γ has no conjugate points on $(0, a)$.
